(54) Title: SYSTEM AND PROCESS FOR FACILITATING THE PROVISION OF HEALTH CARE

(57) Abstract: A system for facilitating the provision of health care to patients, including computerised means (135) for logging patient data relating to health of the patients, and an administration system (105) in communication with the computerised means and configured to determine a risk status of each patient based on the patient data. The administration system is also configured to, for each patient: transmit a first direction to a first health care provider to attend the patient, depending on the risk status of the patient; determine whether the first health care provider has confirmed attendance at the patient within a first time period; and transmit a second direction to a second health care provider to attend the patient within a second time period if attendance by the first health care provider was not confirmed.
